February 2022

## Our market view in a nutshell – February 2022

---

- Over the past month, **inflation has shown no sign of slowing down**. Most price-related indicators (wages, producer prices, etc.) have **continued to surprise on the upside**. Showing that inflation is not only **gaining momentum, but also gaining breadth**. It is no longer just those items of the consumer basket affected by the pandemic that are increasing in price, but also key components such as shelter and health care
- Having missed the initial diagnosis, **the Fed is now trying to figure out how to react appropriately, and financial markets in turn are second-guessing their moves**. A gradual approach would allow the Fed to be “data-dependent” and thus reduce the risk of a hard landing of the economy due to a policy mistake. However, the longer they let inflation run high, the greater the risk that they will lose control of the situation
- With some of the factors causing inflation out of the Fed’s control, and a long transmission of monetary policy to both consumption and corporate investment decisions, **an increase in interest rates has its most immediate impact on the economy through financial assets**. After the correction in stock markets, **house prices appear to be the most vulnerable at the moment**. Investors therefore face the **typical mid-cycle risks**, when they need to constantly assess the length of the economic cycle
- By asset class, we see **attractive valuations in growth and quality stocks**, where the **correction has not been proportional to the impact that higher interest rates** (driven by inflation) may have on these types of companies. Many of them have a unique competitive advantage that allows them to pass price increases on to their customers, thereby largely offsetting the impact on valuations

# Boreal Investment Policy

	Asset Class	View	Rationale
Fixed Income	US Treasuries	+	Treasury bonds offer protection against an economic slowdown and / or increased risk aversion. With interest rates anchored at current levels, and credit spreads that have narrowed massively, we favor long-term US Treasuries
	US Credit	-	The crisis caused by the pandemic will lead to an increase in the number of corporate defaults. Credit spreads hardly reflect this risk currently
	European Sovereign	-	High quality debt in Euros presents a very unattractive combination of risk and return as current yields offer very little cushion to weather potential interest rates increases
	European Credit	-	In European credit we only see value in subordinated debt and Investment Grade
	Emerging Markets	-	Emerging debt is currently unattractive from a risk-return point of view
Equities	US	+	After the sharp sell-off, valuations have improved. We have therefore increased our exposure to US equities, mostly through quality and growth oriented companies
	Europe	-	The European economy has been more affected by Covid than that of the US or Asia. Relaunching it will require a greater fiscal effort, which will have to be financed by new debt. A repeat of the sovereign debt crisis is a real risk
	Asia	+	We recommend investing selectively in the region; favoring high growth stocks
	Emerging Markets	-	Emerging market stocks tend to be more cyclical, and there are fewer quality stocks
	Sectors & Themes	+	Although we continue to like secular growth sectors such as Biotech and Fintech, we are currently reducing direct exposure to them
Alternative Investments	Multi-Strategy Hedge Funds	-	Multi-strategy / multi-manager hedge funds with daily liquidity are having a disappointing performance, particularly when compared with other less risky alternatives, like short-term corporate bonds
	Commodities	-	In the present late-cycle environment, with inflation pressures remaining subdued, we see limited upside for commodities. However, we favor gold in the current negative real interest rates environment
	Private Equity	=	Investing in late-stage private equity provides access to the asset class with liquidity provision up to a certain degree

# Inflation gathers breadth and momentum

- Contrary to expectations, **inflation continues to accelerate** rather than return its pre-pandemic trend
- Not only every inflation metric keeps surprising to the upside, but **inflation is also gaining breadth**; with the rise in prices spilling over into most of the items that make up the consumer basket

# The Phillips curve is alive

- Contrary to what happened during the last economic cycle, when unemployment reached record lows without triggering wage pressures, **we are now witnessing a clear rise in labor costs**

# The cure for high prices is... high prices

- The pandemic has caused a **transfer of consumption from services to durable goods**; which, combined with fiscal stimulus and supply chain bottlenecks, have triggered inflation
- **Consumer prices have been rising faster than household disposable income**, and may end up causing a slowdown in consumption. Something that could be followed by an inventory overhang

## Between a rock and a hard place

- Having been **slow to acknowledge that inflation was a problem, the Fed is now under great pressure** to do something about it; an issue that is also becoming increasingly salient from a political point of view
- However, **the latest tightening cycle is a good reminder** of how many rate hikes the economy can absorb without slowing down

# Monetary tightening has begun

- The fastest and most effective **channel for monetary policy transmission is usually through asset prices**
- We have already seen a **negative wealth effect caused by corrections in financial markets**, and judging by the spike in mortgage rates, combined with declining affordability, the **next adjustment may come from the housing market**

# Recession risks start to be priced

- The market is closely watching the **Fed's moves**, and whether they may increase the likelihood of an economic **slowdown**
- Judging by credit spreads and the shape of the yield curve, **we are clearly entering mid-cycle**. This means that investors must constantly assess the strength of the economy, and that **markets are more vulnerable to corrections**

# Equity valuations offer enough cushion

- A relatively **modest increase in interest rates** has triggered a **large correction in equity markets**; all this while corporate earnings have continued to increase
- As a result, **stock valuations have become cheaper and remain attractive in relative terms**; despite rising bond yields

# A disproportionate correction

- The market has been very harsh with companies that exhibit high growth rates. Despite the fact that many of these companies have a **competitive advantage that allows them to pass on price increases to their customers**; thereby largely offsetting the impact on valuations
- In addition, the correction seems to ignore all the progress made over the last two years. As an example, just look at Zoom, whose revenues have multiplied by a factor of 5, while the stock is trading at pre-pandemic levels

# Investment scenarios

	Scenario 1 Interest rate shock	Scenario 2 “V” Recovery	Scenario 3 “W” Recovery
Drivers	<ul style="list-style-type: none"> <li>• Inflation accelerates due to large fiscal stimulus combined with Infrastructure spending in the US</li> <li>• Commodity prices rise as the global economy bounces back strongly</li> <li>• Central banks try to assure markets that they will not increase interest rates, but long-term rates do increase anyway</li> </ul>	<ul style="list-style-type: none"> <li>• Global recession caused by the unprecedented sudden stop of economic activity</li> <li>• Strict quarantines are avoided and economic activity continues to a greater or lesser extent, depending on control measures of variable intensity</li> <li>• Fiscal and monetary support allow the economy to rebound strongly, while low interest rates make the debt burden manageable</li> </ul>	<ul style="list-style-type: none"> <li>• Deep recession followed by a rapid recovery, but momentum fails to be sustained</li> <li>• Economic activity does not completely return to normal, and high inflation forces central banks to withdraw stimulus</li> <li>• Countries with a stronger fiscal position may be able to provide further stimulus and avert a “W” shaped recovery</li> </ul>
Market impact	<ul style="list-style-type: none"> <li>• Corporate earnings rise sharply, but higher interest rates negatively impact equity valuations</li> <li>• High-quality and sovereign bonds fall due to rising interest rates, failing to play their traditional cushioning role in portfolios</li> <li>• Credit performs relatively better despite higher rates, as the risk of corporate defaults remains low</li> <li>• The US dollar depreciates against safe-haven currencies, as well as against gold</li> </ul>	<ul style="list-style-type: none"> <li>• Equities appreciate moderately, as TINA (“There Is No Alternative”) lure investors back to stock markets, but there is wide dispersion across sectors</li> <li>• Credit spreads recover to pre-crisis levels as the chase for yield intensifies</li> <li>• Wide dispersion between both sovereign bonds and currencies, as yield curves will likely steepen as governments flood the market with new debt</li> <li>• Commodity prices will stabilize</li> </ul>	<ul style="list-style-type: none"> <li>• Wide dispersion in equity and credit markets, with the strongest companies recovering and the weakest lagging behind</li> <li>• Credit spreads widen as the market remains highly volatile and corporate defaults rise</li> <li>• Wide dispersion between sovereign bonds and currencies due to “flight-to-quality”</li> <li>• A relatively strong USD as the US economy turns the corner faster than other developed economies. Wide dispersion within Emerging Markets, as countries exit the pandemic at different speeds</li> </ul>
Probability	35%	35%	30%

## Short-term catalyzers

Slowdown in inflation, acceleration in vaccinations or highly effective treatment for the coronavirus

## Other risks

China slowdown, Crypto bubble crash, Geopolitical (Middle East, Russia, Iran, North Korea)
